

PROJECT NAME: Brigham City Waterline Improvements

RECIPIENT: Brigham City, UT

LOCATION: Brigham City, UT

PURPOSE: Infrastructure funding under the EPA STAG account provides financial assistance to States, municipalities, and tribal governments to fund a variety of water projects. These funds are essential to fulfilling the federal government's commitment to provide adequate funding to construct the facilities that comply with federal environmental requirements to ensure public health and revitalize contaminated properties. This project will provide basic environmental protection and public water system supervision, which are both considered to be core priorities of the EPA STAG program.

In seeking to improve the culinary water system on Brigham's west side, the City has identified several areas of improvement that have the highest priority. Successful completion of this project will enhance the City's water resources for safety purposes, as well as improve the overall culinary water supply system. The Brigham City Waterline Improvements project is comprised of two separate components:

- 1200 W. from Forest to 600 N: this aspect of the project provides a looped water system that will increase both the water volumes and pressures for the business and industrial customers in the northwest quadrant of the City's culinary water supply system.
- 1200 W. from 600 S. to Forest: this component of the project provides the redundancy needed to provide water and fire protection in the southwest quadrant as well as the culinary demand that will be placed on the City's water supply due to the future development of a large, commercial enterprise in the northwest section of the City's limits.

Brigham City is requesting \$838,200 to begin construction activities and installation of these various waterline improvements. The total cost of these improvements is \$1,524,000, and EPA STAG awards require a 45 percent local share of the cost. In this case, the remaining \$685,800 required to complete the project would be provided by a combination of Brigham City utility funds and City general funds.

STAG funds are used to build and enhance the capacity of states, tribal and local governments to carry out compliance assurance activities within their respective jurisdictions. The projects selected cover a wide range of activities that have and will continue to enable states, municipalities, and tribes to demonstrate compliance assurance and enforcement outcomes from their activities while serving as models for other similar entities nationwide.

AMOUNT: \$838,200
